- **Pragmatic Interoperability** goes beyond syntactic (format) and semantic (meaning) interoperability.
  - Ensures exchanged data is interpreted and acted upon consistently in a given **context**.
  - Misalignment arises when the **intended effect**  $\neq$  **interpreted effect**.

# Motivation

- ▶ Interoperability is critical for system collaboration.
- ▶ Pragmatic interoperability focuses on how exchanged data is **used**.
- ▶ Challenge: ensuring that intended and interpreted effects of messages align.
- ▶ Automatic analysis of intentional models can support this.

# Research Design

"A Variation Point is an explicit engineering decision that allows for multiple alternative Variants to be chosen during system development, based on specific Assets."

① "In some systems, the selection of one variation point can lead to dependencies on other variation points. For instance, choosing a movie player might require selecting an audio player as well."

"Means-end links represent the relationship between an 'end' such as a goal, resource, or satisfied goal and alternative 'means' to achieve it, typically expressed as tasks. In a notation, an arrow points from the means to the end."

Performance evaluation of detected independent variation points

ACTUAL VALUES	POSITIVE	NEGATIVE
	POSITIVE	NEGATIVE
POSITIVE	TP	FN
NEGATIVE	FP	TN

$$\text{Precision} = \frac{TP}{TP + FP} \quad \text{Recall} = \frac{TP}{TP + FN}$$

$$F1 \text{ Score} = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}}$$

# Prompt to detect variation point

- ▶ Prompt receives a txt file (raw\_background) with information extracted from articles.
- ▶ Prompt receives the SR model in json file format (goal\_model\_str).

```
# Combine background information with the goal model and with the prompt task.  
prompt = (f"Background: {raw_background}\n\nHere is a goal model: {goal_model_str}."  
         " Detect independent explicit designed variation points in this goal model.")

# Experiment

- ▶ Controlled experiment with GPT-3.5.
- ▶ Zero-shot vs. contextual prompts.
- ▶ Metrics: Precision, Recall, F1-score.

## Experiment steps:

- ▶ Variation point detection.
- ▶ Variant analysis for alignment.

# Element-Level Evaluation (Standard IR Way)- Results achieved in VP detection

Each retrieved *element* is evaluated against  $G = \{A, B, C\}$  (partial credit allowed).

#	Retrieved Set	TP	FP	FN	P	R	F1
1	{A, B, C, D, E, F}	3	3	0	0.50	1.00	0.67
2	{B, C}	2	0	1	1.00	0.67	0.80
3	{A, B, C, D, E, F}	3	3	0	0.50	1.00	0.67
4	{A, B, C, D, E}	3	2	0	0.60	1.00	0.75
5	{A, B, C}	3	0	0	1.00	1.00	1.00

**Macro-avg:**  $P \approx 0.72$ ,  $R \approx 0.93$ ,  $F1 \approx 0.78$

**Micro-avg:**  $P \approx 0.64$ ,  $R \approx 0.93$ ,  $F1 \approx 0.76$

**Reading:** High recall (A,B,C usually found) but precision drops due to extra elements (D,E,F).

# Prompt-Level Strict Evaluation (Exact-Match Rule) - Results achieved in VP detection

A retrieval counts as **True Positive** only if the set is *exactly*  $\{A, B, C\}$ .  
Subsets  $\Rightarrow$  **FN**, supersets (extras)  $\Rightarrow$  **FP**.

#	Retrieved Set	Evaluation
1	$\{A, B, C, D, E, F\}$	False Positive (extra elements)
2	$\{B, C\}$	False Negative (missing A)
3	$\{A, B, C, D, E, F\}$	False Positive (extra elements)
4	$\{A, B, C, D, E\}$	False Positive (extra elements)
5	$\{A, B, C\}$	True Positive (exact match)

**Counts:** TP = 1, FP = 3, FN = 1

**Metrics:** Precision = 0.25, Recall = 0.50, F1 = 0.33

**Reading:** Strict rule is unforgiving; any deviation from  $\{A,B,C\}$  degrades precision and F1.

# Variant analysis for alignment

- ▶ LLM identifies YOLO and RCNN variants.
- ▶ Contextual choices:
  - ▶ Gun in backpack → YOLO.
  - ▶ Police officer with gun → RCNN.

Context	Detector variant chosen
Gun inside a backpack	YOLO detector variant
Police officer with a gun	RCNN detector variant

# Conclusion

- ▶ Proposed process shows potential for supporting pragmatic interoperability.
- ▶ Results promising but precision must be improved.
- ▶ Future directions:
  - ▶ Larger models and tuning.
  - ▶ Retrieval-Augmented Generation (RAG).
  - ▶ Broader application.
